Dashboard code explanation

This project contains a Vega-Lite dashboard for women's health in Australia. The visualisation combines multiple data files and HTML/CSS styling to present a story-driven, multi-chart dashboard.

1. File structure

The main files are vega.html and styles.css. vega.html contains the page layout, chart definitions, and Vega-Lite JSON specs. styles.css contains the visual styling and spacing used across the dashboard.

2. Main HTML structure

The page begins with a masthead and summary statistics strip. Below that are section blocks for mental health, comorbidity/regional access, and procedures/surgery. Each section contains a chart-grid with multiple article elements. Each article holds a chart title, the Vega-Lite render container, and a source line.

3. Vega-Lite chart setup

The dashboard uses a common config object for font and axis styling. Each chart is defined as a Vega-Lite JSON object with a width, height, data source, transforms, mark type, and encoding. These specs are passed into vegaEmbed, which renders the final visualisations in the browser.

4. Data flow

The visualisations read from local JSON files such as mental_health.json, reported_mental_health.json, hysterectomy_state.json, and Selected_procedures.json. Some charts also compute derived values such as rates, percentages, and geographic coordinates for PHN or state comparisons.

5. Styling system

The CSS file controls the grid layout, typography, chart spacing, and colour palette. This keeps the page consistent and reduces unnecessary clutter while preserving readability.

6. Notes for future edits

The chart logic should be changed only when the visualisation design requires it. If you need to update wording, headings, or the narrative flow, make edits in the HTML file. If you want to modify spacing, typography, or card structure, edit the CSS file. The graph marks themselves should remain stable unless a new visual idiom is intentionally required.

This document summarises the code structure of the dashboard and is intended as a quick reference for future edits or review.
